Office

Knowing which files are going to be problematic can save time and money.

TOP BENEFITS OF DATA DISCOVERY

✓ Establish the business case for migrating to MS Office 2010, 2013 or 365

✓ Create a detailed MS Office migration plan

✓ Accurately budget and schedule your MS Office migration

DATA DISCOVERY FOR MICROSOFT OFFICE

Camwood's Data Discovery service for Microsoft Office provides an accurate view of the complexity and longevity of moving to Office 2010, 2013 or 365. You'll understand which files need to be remediated, how long it will take and how much it will cost, plus you'll get a full business justification for the project and a migration plan ready to put into action.

Using Office migration tools from our partner Converter Technology, our consultants will analyse your Microsoft Office environment and provide a report detailing every file that will need remediation for the migration to be completed successfully. These are typically data files that are password- protected, contain VBA code or links and charts, or that have been previously migrated from earlier versions of Office.

HOW IT WORKS

ANALYSIS

We'll give you a detailed report on every Office file in the environment, covering: – Files that are password-protected – Files that contain VBA code (VBA code does not run or function in Office 365) – Files that contain links or charts – The age of each file – Recommended remediation work in each case

REPORT CREATION

We'll hold a one-day 'findings' workshop with you to analyse the results, determine the cost and time implications of the remediation work required, and create a business justification and plan for the migration.

FINDINGS WORKSHOP

We'll hold a one-day 'findings' workshop with you to analyse the results, determine the cost and time implications of the remediation work required, and create a business justification and plan for the migration.
